

22-52-Q3-C

Q

(c) k -fold

describe

rationality.

Solution c)

In k -fold cross validation, the data set is divided into k -completely distinct or non-overlapping random partitions called folds.

Each of the k folds is given an opportunity to be used as a held back test set, whilst all other folds collectively are used as a training dataset.

A total of k models are fit and evaluated on the k hold-out test sets and the mean performance is reported.
